

TECHNICAL MEMORANDUM

TO: For applicant submittal to the TOWN OF APPLE VALLEY

FROM: Perrie Ilercil, Senior Engineer | GANDDINI GROUP, INC.

DATE: April 2, 2025

SUBJECT: Apple Valley Truck and Trailer Facility Project Trip Generation Analysis
GGI Project No. 19763

Ganddini Group, Inc. is pleased to provide this Trip Generation Analysis for the proposed Apple Valley Truck and Trailer Facility project in the Town of Apple Valley. The purpose of this memorandum is to supplement the Air Quality Impact Study with a more detailed project description and trip generation information for the truck-trailer parking facility included in the Apple Valley Truck and Trailer Facility project. We trust the findings of this analysis will aid the Town of Apple Valley in assessing the project.

PROJECT DESCRIPTION

The 14.86-acre project site (APN: 0440-014-11) is located on the southside of Waalew Road between Ramona Street and Navajo Road in the Town of Apple Valley, California. The project site is currently vacant and zoned Planned Industrial (I-P).

The proposed project involves the development of truck and trailer parking lot with 426 truck/trailer parking spaces (12' by 55') and three standard parking spaces (9' x 19'). The proposed project will serve as overflow parking for trailers and semi-trucks associated with other industrial developments in the project vicinity. Vehicle access for the project site is proposed via gated access to Waalew Road. The proposed site plan is shown in Attachment A.

TRIP GENERATION

Since the Institute of Transportation Engineers (ITE) *Trip Generation Manual* (11th Edition, 2021) does not include trip generation data for truck trailer parking facilities, trip generation rates for the proposed project were obtained from trip counts conducted at comparable facilities.

Observed Counts

The 24-hour, bi-directional trip counts were conducted at five (5) existing truck-trailer parking facilities which serve as overflow parking lots for trailers and semi-trucks similar to the proposed parking facility. The driveway count is provided in Attachment B.

Truck Trips

The project trip generation was also calculated in terms of Passenger Car Equivalent (PCE) trips. Truck trips were converted to PCE trips based on the PCE factors as recommended in the *County of San Bernardino Congestion Management Program*: 1.5 for 2-axle light-duty trucks, 2.0 for 3-axle medium-duty trucks, and 3.0

for 4+-axle heavy-duty trucks.

Truck-Trailer Parking Facility

The trip generation analysis derived trip generation rates from counts of the existing truck trailer parking facilities which are for overflow truck-trailer storage. Based on the observed trip counts, trip generation rates were calculated per acre for the passenger car and truck vehicle classifications. Table 1 identifies the five (5) sites counted, the peak hour and daily trips at each site and the daily, AM and PM peak hour trip generation for each vehicle classification at each site. The rates for the sites are then used to determine an average trip generation rate for this type of facility.

Project Trips

Table 2 shows the proposed project trip generation forecast is based on average rates developed from trip count surveys of similar facilities. As shown in Table 1, the project is estimated to generate approximately 465 daily vehicle trips, including 30 vehicle trips during the AM peak hour and 36 vehicle trips during the PM peak hour, which equates to approximately 867 daily PCE trips, including 58 PCE trips during the AM peak hour and 63 PCE trips during the PM peak hour.

TRIP GENERATION COMPARISON

The original project trip generation provided in the *Apple Valley Truck and Trailer Facility Traffic Impact Analysis*, October 14, 2024 ["Project TIA"] report is included in Attachment C. The original trips were determined from counts for active truck-trailer yards which have trucks picked up daily or several times a week.

The proposed site is an overflow parking lot which will store trucks and trailers and will not have the vehicle turn over which occurs in an active truck-trailer yard. Therefore, new counts were conducted for overflow truck-trailer facilities to reflect the anticipated vehicle trips more closely at the proposed project.

Table 3 shows the difference in project trip generation between the original projection and the revised forecast based on the overflow truck-trailer facility trip generation. As shown in Table 3, the revised project is forecast to generate approximately 201 fewer daily trips compared to the Project TIA trip generation, including 3 fewer trips during the AM peak hour and 7 fewer trips during the PM peak hour of which there are 131 fewer daily trucks trips including 2 fewer trips during the AM during the AM peak hour and 5 fewer trips during the PM peak hour.

CONCLUSION

New counts at similar facilities are used to revise the trip generation for overflow truck facilities. The proposed project trip generation is forecast to generate a total of approximately 201 fewer daily trips compared to the original project, of which there are 131 fewer daily trucks trips than previously reported in the Project TIA.

It has been a pleasure to assist you with this project. Should you have any questions or comments, please contact Perrie Illecil at (714) 795-3100 ext. 103 or perrie@ganddini.com.

Total		23	37	60	44	31	75	1,240

Notes:

1. AC = Acre(s)

2. Source: Trip generation surveys conducted at five existing trailer storage facilities in Southern California; see Appendix B.

3. PCE = Passenger Car Equivalent.
