SECTION 1

DISCUSSION

INTRODUCTION

The purpose of this study was to determine the impact, if any, of the 100-year storm runoff flow tributary to the project site as delineated on the map contained in this study. The project site encompasses approximately 40 acres of vacant property located on the east side of Dakota Road between Gustine Street to the north and Fresno Road to the south. The site is located on the west side of the Apple Valley Airport within the North Apple Valley Industrial Specific Plan in the Town of Apple Valley, CA. Future development of the site will be construction of a warehouse facility.

METHODOLOGY

The method in determining these peak runoff flows was the rational method and the unit hydrograph method as specified in the 1986 San Bernardino County Hydrology Manual and the 2010 San Bernardino County Hydrology Manual Addendum for Arid Regions. The existing offsite flow was examined and delineated from U.S.G.S. Map: Apple Valley North and an examination of the project site.

Point rainfalls for the 100-year storm were obtained from the NOAA Atlas 14 per the 2010 Addendum to the County Hydrology Manual. The 100-year 1-hour point rainfall for the site is 1.06". Per the afore-mentioned addendum, AMC II was used for the project site and the soil types were determined to be Soil Type A throughout the watershed with a small, localized area of Type C soils at Node 21 of the watershed per the Natural Resources Conservation Service's "Web Soil Survey". Rainfall and soils maps are included as exhibits in Section 3 of this report.

The watershed area tributary to the northern boundary of the proposed project, Gustine Street, is approximately 383 acres. The watershed area tributary to the eastern boundary of the project, the proposed extension of Ramona Road, is approximately 130 acres. The rational method was used to analyze the storm runoff from these watersheds. There are minor areas of existing scour within the site from past storm runoff flows and evidence of runoff in the form of sheet flows crossing the project.

The offsite tributary areas examined in this study are shown in Table A.

Table A

Sub-area	Elevation Difference (ft.)	Length (ft)	Area (Acres)	Avg. Slope (ft/ft)
Node 11 – Node 17	167	11,475	382.8	0.0146
Node 21 – Node 26	107	6,770	129.6	0.0158

EXISTING CONDITIONS

The site encompasses approximately 40 acres of vacant property located on the east side of Dakota Road between Gustine Street to the north and Fresno Road to the south. The watershed area tributary to the northern boundary of the proposed project, Gustine Street, is approximately 383 acres. The watershed area tributary to the eastern boundary of the project, the proposed extension of Ramona Road, is approximately 130 acres. There are minor areas of existing scour within the site from past storm runoff flows and evidence of runoff in the form of sheet flows crossing the project.

The results of the offsite and onsite flow analysis are summarized in Table B.

Table B

Sub-Area	Q₁₀₀ (cfs)
Node 11 – Node 17	165.3
Node 21 – Node 26	71.5

CONCLUSIONS AND RECOMMENDATIONS

During our field investigation of the site, we observed the existing conditions as stated previously. Development of the project site is a warehouse facility being designed with engineered grading and drainage plans. Runoff from the north will be intercepted within the street improvements of Gustine Street and conveyed around the proposed warehouse with a storm drain system in the proposed street right-of-way. The storm drain system will convey runoff flows to their historical flow location along the southern project boundary on Fresno Road.

Storm runoff from the east will be intercepted within the street improvements of Ramona Road. These flows will also be conveyed around the warehouse facility within a storm drain system in the proposed street right-of-way to their historical flow location within Fresno Road. The two storm drains join together on the north side of Fresno Road and convey the storm runoff south of Fresno Road to an existing drainage swale along the south side of Fresno Road. The runoff will bubble out into the swale following its historical flow path.

SOILS MAP

Hydrologic Soil Group—San Bernardino County, California, Mojave River Area

MAP LEGEND

MAP INFORMATION

The soil surveys that comprise your AOI were mapped at 1:24,000.

Please rely on the bar scale on each map sheet for map measurements.

Source of Map: Natural Resources Conservation Service
Web Soil Survey URL:
Coordinate System: Web Mercator (EPSG:3857)

Maps from the Web Soil Survey are based on the Web Mercator projection, which preserves direction and shape but distorts distance and area. A projection that preserves area, such as the Albers equal-area conic projection, should be used if more accurate calculations of distance or area are required.

This product is generated from the USDA-NRCS certified data as of the version date(s) listed below.

Soil Survey Area: San Bernardino County, California, Mojave River Area
Survey Area Data: Version 15, Aug 30, 2023

Soil map units are labeled (as space allows) for map scales 1:50,000 or larger.

Date(s) aerial images were photographed: Mar 17, 2022—Jun 12, 2022

The orthophoto or other base map on which the soil lines were compiled and digitized probably differs from the background imagery displayed on these maps. As a result, some minor shifting of map unit boundaries may be evident.

Hydrologic Soil Group

Map unit symbol	Map unit name	Rating	Acres in AOI	Percent of AOI
118	CAJON-ARIZO COMPLEX, 2 TO 15 PERCENT SLOPES*	A	13.3	2.5%
133	HELENDALE-BRYMAN LOAMY SANDS, 2 TO 5 PERCENT SLOPES*	A	515.5	96.5%
158	ROCK OUTCROP- LITHIC TORRIORTHENTS COMPLEX, 15 TO 50 PERCENT SLOPES*		5.6	1.0%
Totals for Area of Interest			534.4	100.0%

Description

Hydrologic soil groups are based on estimates of runoff potential. Soils are assigned to one of four groups according to the rate of water infiltration when the soils are not protected by vegetation, are thoroughly wet, and receive precipitation from long-duration storms.

The soils in the United States are assigned to four groups (A, B, C, and D) and three dual classes (A/D, B/D, and C/D). The groups are defined as follows:

Group A. Soils having a high infiltration rate (low runoff potential) when thoroughly wet. These consist mainly of deep, well drained to excessively drained sands or gravelly sands. These soils have a high rate of water transmission.

Group B. Soils having a moderate infiltration rate when thoroughly wet. These consist chiefly of moderately deep or deep, moderately well drained or well drained soils that have moderately fine texture to moderately coarse texture. These soils have a moderate rate of water transmission.

Group C. Soils having a slow infiltration rate when thoroughly wet. These consist chiefly of soils having a layer that impedes the downward movement of water or soils of moderately fine texture or fine texture. These soils have a slow rate of water transmission.

Group D. Soils having a very slow infiltration rate (high runoff potential) when thoroughly wet. These consist chiefly of clays that have a high shrink-swell potential, soils that have a high water table, soils that have a claypan or clay layer at or near the surface, and soils that are shallow over nearly impervious material. These soils have a very slow rate of water transmission.

If a soil is assigned to a dual hydrologic group (A/D, B/D, or C/D), the first letter is for drained areas and the second is for undrained areas. Only the soils that in their natural condition are in group D are assigned to dual classes.

Rating Options

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS). Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values. Please refer to NOAA Atlas 14 document for more information.
